SchuF Control Valves Introduction

Control valves work to keep a process variable such as flow or pressure within a predefined operating range. They are often the last piece of equipment in a process loop that can compensate a load disturbance and are therefore considered critical valves.

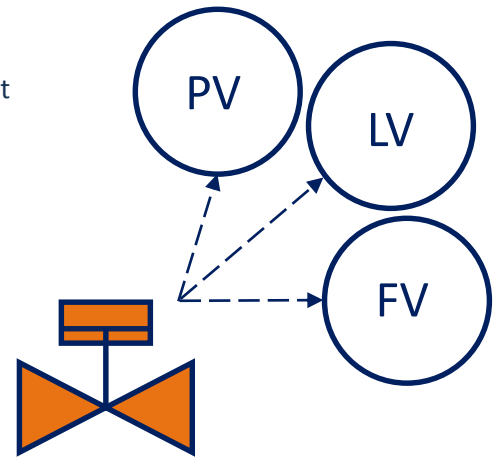

Why choose SchuF?

The SchuF Group is an industry-renowned valve supplier with over 100 years' experience designing and manufacturing application-specific valve solutions.

SchuF has developed over 20,000 control valve variations in its hundred-year history. Each has its own specific characteristics tailored to the process control elements that are most important for it – pressure, level, flow or temperature.

SchuF has the capability to ship our unique and highly-praised valve solutions worldwide from production facilities located in Germany, India, Ireland, Italy, the United Kingdom and the United States.

SchuF has an extensive product selection with a vast and diverse range of applications, from oil production to concrete manufacture. SchuF's skilled team of engineers and product specialists design each valve, from the ground up to meet specific application requirements and provide optimal service life and performance.

Where does SchuF use its expertise?

- **Discharge and feed flow-control valve** in PET, PVC, PP & PE reactors
- **Level, pressure & steam injection control** valves in PTA processes
- **Level control** of flashing fluid in coal liquefaction or heavy oil upgrading
- **Feed and level control** for gasification according to the Siemens, Lurgi, GE and Shell process licenses
- **Flow control of powder** in fine chemical & pharmaceutical processes
- **Resurge and flare control** for gas
- **Steam, feedwater and condensate control** in power generation and Cogen/CHP facilities
- **High-precision multi-port flow control** of highly viscous, non linear, non-Newtonian polymer fluids
- **Discharge flow control valves** for urea reactors where urea-grade stainless steel is mandatory
- Fully-jacketed **short-body wafer control valves**, for Nylon and PC production
- **Mineral processing** applications such as high-pressure acid leaching (HPAL)
- **Sour water and Amine letdown** in several refinery processes
- **Bio - Fuels** (Renmatix)
- **Hydrocarbon fluid separation and injection** in Oil and Gas industries

Control Valve Types

In line Control Valves

Straight Globe Valve – Type 72

Straight Globe control valves combine the protection of a bellows seal with the controllability and leak-tightness of a SchuF control valve. They are used in arduous and lethal services with critical media such as chlorine, phosgene, hydrofluoric acid, NH_3 , CO_2 , urea etc. They are Eurochlor compliant.

- Designed for at least **20.000 operations**
- **Emergency stuffing boxes** as standard
- **Linear, equal % or on/off** control
- Optional **bellows** fitted in bonnet **to protect against erosion**
- Wide **variety of control trims** available (see page 8-10)
- Loose self-aligning disc for **absolute shut-off**, (ASME Class VI)
- **Metallic sealing surfaces** with different hardness (Stellite® ...)

Y - Globe Valve - Type 50

The Y-globe control valve can be installed in process lines from 1 inch to 24 inches and is **ideal to control flow or to reduce pressure**. It has a **sturdy design, superior flow and control characteristics** (compared to globe or ball control valves) and **zero-leakage sealing performance**.

- **High throughput** (e.g. 4" (DN 100) – Cv min 140 to max 300)
- Flow optimized – **low pressure drop**
- **Equal %, linear or custom control characteristics**
- **Class VI process shut-off and zero leakage to atmosphere** performance
- **Dead-and slow-space-free** options

Wafer Valve – Type 76

Ideal for limited-space control applications

- **Space-saving** design
- **Cost-optimised**
- **Linear or equal %**
- **½ inch to 3 inch**
- **Up to ASME Class 2500**

Control Valve Types

In line Control Valves

V-notch Ball Valve

By choosing the SchuF line of characterized **V-Control ball valves**, a full range of control applications is available with **superior flow control**. These quarter-turn-control ball valves are **more compact, lighter weight and much less expensive** than comparably sized globe valves and segmented control valves currently available in the market.

- Superior rangeability and repeatability
- High flow capacity
- Ability to function with fluids containing **solids and fibers**
- Ease of maintenance
- Exceptional interface with PLCs and computer command signals
- SchuF's **high-quality pneumatic and electric control actuators**
- Accurate positioning

Segmented Ball Valve

The SchuF **Segmented Ball Valve** offers an **accurate control** with a **clogging free design**. **High capacity** and **superior sealing properties** make this valve type a perfect In-Line valve for control purposes, even with **high solid content mediums**.

- Superior rangeability and repeatability
- High flow capacity
- Ability to function with fluids containing **solids and fibers**
- Flow optimized – **low pressure drop**
- **Erosive medium control**
- Ease of maintenance and seal replacement
- Accurate positioning

Control Valve Types

Angle Control Valves – Model 74

The SchuF Model 74 Angle Control Valves are designed for critical or severe applications involving level control and pressure let-down in High Pressure Acid Leach (HPAL), Hydrocracking, Coal Liquefaction, PTA and other demanding processes.

The SchuF Angle Control Valve is often custom-made to suit process requirements in order to optimise field performance. Valve bodies are designed to help extend service life, by preventing impingement of particles on internal surfaces. Stagnant areas are minimized to prevent build-up of slurry or scale.

X-Flash – Type 74BS

These **valves open into the downstream** vessel to **eliminate choking** and **cavitation**. The “accelerating body” design prevents in-body flashing.

- **High CV values (1 to 3000)**
- **Low wear and tear**
- Disc opening **eliminates plugging** by sediments
- **Best suited for vessel installation**

X-Flash – Type 74BS

Tough Flash – Type 74CS

If piping considerations prohibit a disc-opening valve, the 74CS accommodates flashing in the valve while **opening the disc into the body**. The effects of cavitation are minimised by the use of suitable trims.

- **Hard material trim**
- **Flashing occurs in the protected seat/ choke tube area**
- **Up to 180 bar let-down** is possible in a **single stage**
- **Customised and replaceable choke tube**
- **Suitable for pipeline or vessel installation**

Tough Flash – Type 74CS

Control Globe Valve Bonnet Selection

Control Valve Actuators

SchuF Control Curve Characterisation

Linear

Linear flow characteristics are those where, for example, a 1% change of the total valve stroke will result in a flow rate change of 1% of the total flow. This ensures that, for a constant pressure drop, the valve gain is more or less constant at all flows. Linear characteristics are suitable for most straightforward applications.

Equal Percentage

Equal Percentage flow characteristics are commonly used where pressure differential across the valve goes down as the flow rate Increases, and are ideal for more complex process control. Equal percentage valves open progressively more area as the valve is stroked open, so, for example, every 10% increase in stroke would result in a fixed percentage increase in the flow rate prior to adjustment- all across the stroke range.

Quick Opening

Quick-Opening flow characteristics, as implied by the title, allow maximum changes in flow rate following small initial changes in valve stroke. As the valve travel approaches the fully open position, valve flow-rate changes approach zero. This characteristic is commonly used for on-off service.

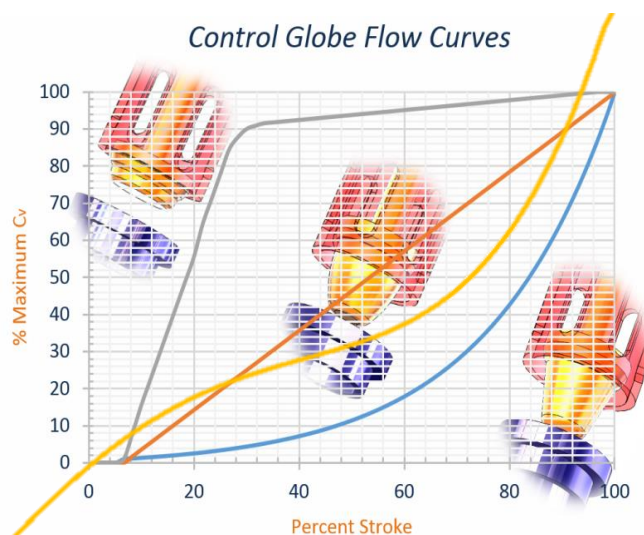

SchuF x³ Bell Curve

SchuF’s patented x³ bell curve is available as an alternative to the above characteristics. The hybrid qualities of the x³ bell curve offer considerably improved controllability of the process.

Curve Types

- Linear
- Equal Percentage
- Quick Opening
- SchuF x³

Valve Size		Available trim Cv for Standard Trims

Special Trim Types

Cage

Ideal for **energy dispersion** and **noise** control

- Multi-hole cage design – to achieve **accurate flow characteristics and noise attenuation**
- **Class VI (API 598) shut-off** is achieved, eliminating unacceptable leakage
- **Linear or Equal %** control characteristics
- Available with fast-opening actuators, and smart positioners

Valve Size		Available trim Cv for Cage Trims

Needle Spline

Ideal for **micro flow** applications from **CV values up to 5**.

- The needle spline provides **optimum rangeability and accurate flow control**.
- Excellent performance with **high solid content** media for **severe applications**
- Provides **optimum guidance** of the control head **to prevent fracture** when using hard metals
- **Bigger CV values** are also available on request

Valve Size		Available trim Cv for Needle Spline Trims

1	25	Microflow from 0,01 up to 5
1,5	40	
2	50	
3	80	

Special Trim Types

Stacker – Kinetic Energy Control Solution

By **controlling** the process through a series of torturous **paths of expansions, contractions, fluid impingement and splitting channels**, the **exit velocity is reduced** to a less aggressive level. Specially designed packing scraper and flow passage geometry **prevents solids building up** and **reduces** the need for **servicing and production downtime**:

- **More than 30 stages** available
 - Greatly reducing erosion, flashing damage, clogging and noise
 - Eliminating cavitation, vibration and hydrate/condensate formation
- Up to ASME Class 4500 (PN640)
- All body shapes available
- Class V and MSSP-61 shut-off
- For valve dimensions please consult factory

18	450	700	
20	500	1000	

Multi Stage Axial Flow

Ideal to let down high pressure over several stages and avoid cavitation:

- **2, 3 or up to 6 staged** pressure - reduction disc design
- **Up to ASME Class 2500 as standard**
- True **Equal %** characteristics
- **High CV values** (1 to 3000)
- **Large outlet chamber** to reduce velocities
- **Disc opening** direction eliminates plugging by catalyst fines or other sediments

Product Portfolio Overview

The SchuF Group has delivered over one million valves during its 100 year history, to a wide variety of industries in over 50 countries worldwide.

Headquartered near Frankfurt, Germany, the company has additional design and manufacturing centres in India, Ireland, Italy, UK, and the USA.

The SchuF Group has sales and agent offices servicing virtually every country in the world.

We manufacture valve products that control, isolate, divert, and sample liquids, gases, powders, and slurries. Our extensive product range of engineered, customized valves includes:
